 - j. The software should provide reporting capabilities to display trend graphs, configurable alerts in accordance with CECB SOP and otherwise, tabular data, charts and data validation interface.
 - k. The software should provide the ability to annotate the validated data with the industry comments (Industry would have to comment on the data if clarifications are raised by CECB) and data quality codes. Software should have the ability to make the annotations visible while viewing the data in the charts, if chosen by the User.
 - l. The software also should provide ability to develop custom made on-demand reports with capabilities to export the data into PDF, CSV and Excel formats. The reports developed should be printable on any of the standard printers.

 - n. The ability to generate the encryption keys for the client-side software should be provided to CECB, so that the board can provide authorized keys to the individual sites for secured data transmission. There should not be any financial implication to CECB for generation of such keys and it should be a software feature.
 - o. Publishing of data shall be at the end of the regulator and should have necessary components in-built in the system to publish valid data only.

- ii. No data shall be accepted as an output from OPC of Server or DCS or any other intermediate software at Industry side.
- iii. The data collection and transmission module should encrypt the data with unique client specific encryption key to ensure authentic data transfer from the industry to the central server. Only encrypted and authenticated data shall be received by the Central Server Module.
- iv. During internet connectivity failure or a communication issue with the central server, the data collection and transmission module should store the encrypted data locally and retransmit when the connectivity restored, and data transmission is possible. Any such delayed transmission should be identifiable at the regulator side using data quality codes.
- v. The data collection and transmission module should wait for acknowledgement from the server and should re-transmit the data if no acknowledgement is received within the timeout period. Systems should at a minimum be equipped with QoS-2 transfer protocol.
- vi. Software should support reading analyser configuration and report the configuration changes to the central server. Any configuration changes done at the site should have audit trail and reported to the regulator for approval in the form of workflow.
- vii. The data collection and transmission module should support remote analyser configuration. The data collection and transmission module should accept remote analyser configuration commands and update the analyser configurations with the set value.
